Document Part No.: TPEN19840/230927

Release Date: August 2025

Protected by U.S. Patent No.: Pending

This documentation introduces the main features of the product and/or provides installation instructions for a production environment. Read through the documentation before installing or using the product.

Detailed information about how to use specific features within the product may be available at the Trend Micro Online Help Center and/or the Trend Micro Knowledge Base.

## **Privacy and Personal Data Collection Disclosure**

Certain features available in Trend Micro products collect and send feedback regarding product usage and detection information to Trend Micro. Some of this data is considered personal in certain jurisdictions and under certain regulations. If you do not want Trend Micro to collect personal data, you must ensure that you disable the related features.

The following link outlines the types of data that TippingPoint Security Management System collects and provides detailed instructions on how to disable the specific features that feedback the information.

<https://success.trendmicro.com/data-collection-disclosure>

Data collected by Trend Micro is subject to the conditions stated in the Trend Micro Privacy Notice:

# Chapter 1

## Overview

The Trend Micro™ TippingPoint™ Virtual Security Management System (vSMS) is a software-based SMS appliance that operates within a virtual environment. The vSMS platform enables you to manage an unlimited number (of any model) of TippingPoint devices. The vSMS platform provides the same functionality, the same user interfaces, and operates the same as a physical SMS appliance.

Before you install vSMS, see the latest *Security Management System Release Notes*. After you deploy and configure vSMS, refer to the SMS documentation to operate and administer vSMS.

To ensure that you have the latest versions of product documentation, visit the [Online Help Center](#).

You must have a supported virtual environment already installed and configured before you deploy the vSMS.

## System requirements

This section provides the requirements needed to deploy the vSMS in a VMware, a kernel-based virtual (KVM), or Microsoft Hyper-V environment.

The following are the minimum system requirements for the vSMS platform:

- 300 GB virtual disk size. For a larger disk partition, this size can be dynamically increased. A size of 600 GB is recommended. The maximum supported size is 1800 GB.
- 8 virtual CPUs
- 2.27 GHz CPU speed
- 32 GB memory
- 2 virtual network adapters. Two virtual network adapters are required to match a physical SMS. One of the virtual network adapters is for management. The second one is required for High Availability out of band replication, even if replication is not in use. For High Availability clusters, both systems must have similar memory, CPU, and disk space.

**Note**

An upgrade will fail on any system that has a drive that is smaller than 300 GB or less than 12 GB of RAM.

---

### VMware vSphere environment

A supported VMware vSphere environment must already be set up before you can install and use the vSMS. The vSMS platform uses a VMware Open Virtualization Format (OVF) file to operate.

- VMware vSphere Client version 7.0 or 8.0
- VMware ESX/ESXi version 7.0 or 8.0 (only paid versions supported)

**Note**

We recommend that you install all updates on your hypervisor hosts before deploying virtual devices in your ESXi environment.

---

## **KVM environment**

A supported KVM environment must already be set up before you can install and use the vSMS. KVM deployment of the vSMS has been successfully tested using the following specifications:

- RHEL version 6 (for three cores); libvirt version 0.10.2; QEMU version 0.12.0.
- RHEL version 7 with the KVM hypervisor (for four cores); libvirt version 1.1.0; Quick Emulator (QEMU) version 1.5.3

The KVM environment must have the following tar packages installed:

- `qemu-kvm`
- `virt-install`
- `virt-viewer`

## **Microsoft Hyper-V environment**

The vSMS host for Windows Hyper-V configurations is version 10.0. This version is supported on the following Windows servers:

- Windows Server 2022
- Windows Server 2025

# Migration

## Important

You can upgrade the vSMS to this release directly from vSMS v6.2.0 or later. If you are running vSMS versions older than v6.2.0, upgrade to v6.2.0 before upgrading to this release, or redeploy the vSMS directly. [Learn more](#) about paths for upgrading.

If you are upgrading your vSMS to TOS v6.2.0 or later in a KVM environment, you must ensure that the CPU is reconfigured to support a minimum of x86-64-v2, ARMv8.0-A, POWER9, or z14 processing. To do this, do any of the following:

- Update the CPU details in the virt-manager user interface's Console view (**Edit>Virtual machine details>View details>CPUs** and check the **Copy host CPU configuration** checkbox.
- Edit the CPU details by using `sudo virsh edit NAME` on the KVM server command line. Change the CPU host to 'host-model', and remove any existing feature policy entries before saving the file:

```
<cpu mode='host-model' check='partial'>
  <model fallback='allow'/>
  <topology sockets='x' cores='y' threads='z'/>
</cpu>
```

If you made any changes to the KVM vSMS configuration, shut down and restart the image for them to take effect.

- 
1. Back up the vSMS database.

## Note

For added assurance, take a snapshot of the vSMS virtual appliance using the tools in your virtual environment.

---

2. Remove the vSMS virtual appliance from the virtual environment.
3. Deploy the new vSMS virtual appliance into the virtual environment.
4. Restore the vSMS database backup to the new virtual appliance.

Alternatively, if you have sufficient resources on your virtual host, you can shut down the vSMS virtual appliance, turn it off, deploy the new vSMS virtual appliance, and restore the backed up database. After you verify the integrity of the restored database instance, you can then delete the old virtual appliance from the virtual environment.

## Installation summary

The TippingPoint vSMS installation and configuration involves the following components:

- VMware environment
  - VMware vSphere Client
  - VMware ESX/ESXi (only paid versions supported)
  - VMware Open Virtualization Format (.ovf) file and a .vmdk file
- KVM environment
  - RHEL system
  - Tar package
- Windows Hyper-V environment
  - Windows Hyper-V Manager
  - Windows Server 2022 or Windows Server 2025
- vSMS software package
- vSMS software package MD5 checksum
- Certificate package

To install the vSMS package, validate the virtual environment where you want to deploy the virtual appliance, obtain the software package and the

MD5 checksum from the TMC, obtain the vSMS Software License Key from Trend, and then perform the deployment using the following steps.

STEP	TASK
Step 1	<a href="#">Validate the virtual environment on page 2-2</a>
Step 2	<a href="#">Obtain the vSMS software package on page 2-2</a>
Step 3	<a href="#">Download the vSMS certificate package on page 2-3</a>
Step 4	<a href="#">Deploy the vSMS software on VMware on page 2-4</a> OR <a href="#">Deploy the vSMS software on KVM on page 2-6</a> OR <a href="#">Deploy the vSMS software on Microsoft Hyper-V on page 2-8</a> OR <a href="#">Deploy the vSMS software on OpenStack on page 2-11</a>
Step 5	<a href="#">Configure the vSMS server on page 3-2</a>
Step 6	<a href="#">Install the vSMS certificate package on page 3-3</a>
Step 7	<a href="#">Install the SMS client on page 3-3</a>
Step 8	<a href="#">Log in to the SMS on page 3-6</a>

# Chapter 2

## Installation

Before you begin, see the [Installation summary on page 1-5](#) and the latest *Security Management System Release Notes* available on the TMC.

Perform the following tasks before you deploy the vSMS software:

1. [Obtain the vSMS software package on page 2-2](#)
2. [Download the vSMS certificate package on page 2-3](#)

Perform the following tasks through your virtual environment:

1. [Deploy the vSMS software on VMware on page 2-4](#)
  - or- [Deploy the vSMS software on KVM on page 2-6](#)
  - or- [Deploy the vSMS software on OpenStack on page 2-11](#)
  - or- [Deploy the vSMS software on Microsoft Hyper-V on page 2-8](#)
2. [Configure the vSMS server on page 3-2](#)
3. [Install the vSMS certificate package on page 3-3](#)

## Validate the virtual environment

Before you deploy vSMS, ensure your virtual environment meets the system requirements described in *System requirements on page 1-2*.

**Note**

If you are deploying the vSMS on VMware, you cannot adjust physical resource settings during initial deployment of the vSMS. To adjust the settings, first deploy vSMS, and then use the vSphere client to modify the physical resource settings. Note that once disk size is increased it cannot be decreased.

---

## Obtain the vSMS software package

The vSMS software package is distributed to customers through the TMC. Download the software from the TMC and store it in a location accessible from your virtual environment.

Perform the following steps to obtain the software:

---

**Procedure**

1. In a Web browser, open the [TMC](#), and then log in.
2. Select **Releases**, and then select **Software > SMS > Virtual SMS (vSMS)**.
3. On the vSMS Software Package page, select the software package.
4. Note the MD5 checksum displayed in the “Message” area of the Software Details page. You will compare it against the checksum you generate after you download the file to your local system.
5. Click **Download**.
6. Accept the End User License Agreement, and save the file to a storage location that is accessible from your virtual environment.
7. Generate an MD5 checksum against your local copy of the .zip file, and then compare it against the MD5 checksum shown on the TMC.

**Note**

If the checksum does not match, make sure you have the right package and download again or contact product support.

---

**8. Unzip the vSMS software package.**

To deploy the vSMS on a KVM environment, the software package includes a tar package.

To deploy the vSMS on a VMware environment, the software package expands into separate files, which are needed to deploy the SMS virtual appliance. The file names are similar in format to the following:

```
vsms-6.5.0.208894-signed-disk1.vmdk
```

```
vsms-6.5.0.208894-signed.cert
```

```
vsms-6.5.0.208894-signed.mf
```

```
vsms-6.5.0.208894-signed.ovf
```

**Note**

The .vmdk file must be in the same folder as the .ovf file when you deploy the vSMS software.

---

To deploy the vSMS in a Windows Hyper-V environment, the software package expands into three different sub-directories:

- Snapshots
  - Virtual Hard Disks
  - Virtual Machines
- 

## Download the vSMS certificate package

Download the vSMS certificate package from the license manager after you complete your product purchase order through your regular sales channel.

After you download the vSMS certificate package, install the certificate. See [Install the vSMS certificate package on page 3-3](#) for more information.

### To download the vSMS certificate package

---

#### Procedure

1. Open the license manager.  
To access the license manager, go to the TMC, and navigate to **My Account > License Manager**.
  2. From the License Management page of the license manager, click **Download Cert**.
  3. Select **vSMS Cert** from the drop down options.  
The vSMS Certificate Package page displays on the TMC.
  4. Click **Download**.
  5. Accept the EULA Agreement.
  6. Save the vSMS certificate zip file to a local folder that is accessible from your virtual environment.
- 

## Deploy the vSMS software on VMware

The vSMS is a virtual appliance compressed and packaged according to the VMware Open Virtualization Format (OVF).

A supported VMware vSphere environment must already be set up before you can install and use either vSMS solution. For more information, see [System requirements on page 1-2](#).

#### Important

VMware vCenter server is not required to deploy the vSMS .ovf file. You can deploy the .ovf file directly through ESX/ESXi utilities.

---

---

## Procedure

1. Use the VMware vSphere client to log on to and access the ESX/ESXi host where you want to deploy the vSMS.
2. Select the host where you want to deploy the vSMS.

When you deploy the vSMS, be sure to deploy it onto an ESX/ESXi host that has network access to the devices you want the vSMS appliance to manage.

3. Use the following steps to deploy the vSMS .ovf file:
  - a. Click **File > Deploy OVF Template**.
  - b. Locate the \*.ovf file you obtained when you unzipped the vSMS software package, and then click **Next**.
  - c. Verify the template details, and then click **Next**.
  - d. Specify a name and a location for the vSMS, and then click **Next**.
  - e. Specify a host/cluster where you want to deploy the vSMS, and then click **Next**.
  - f. Select a datastore for the vSMS, and then click **Next**.

### Note

If the storage page of the OVF deployment wizard indicates the host where you are installing the vSMS appliance does not provide sufficient disk space, you should deploy the vSMS appliance to a different host that has sufficient disk capacity. If you do not have another host where you can deploy the vSMS appliance, select Thin Provision format in the next step.

- g. Choose a format for storing the virtual disks:
  - **Thick Provision Lazy Zeroed** – Storage is immediately allocated, data remaining on the physical device is zeroed out on demand.

- **Thick Provision Eager Zeroed** – Storage is immediately allocated, data remaining on the physical device is zeroed out when the virtual disk is created.
  - **Thin Provision** – Storage is allocated on demand.
- h. Select a **Destination Network** to which to map the source network in the OVF template.
  - i. Verify the deployment settings on the summary screen, and then click **Finish**.

The vSMS deployment is complete.

4. After the OVF deployment process completes, right-click the vSMS virtual machine, and then select **Edit Settings**.
  5. Confirm that the first network interface is assigned to the virtual network with access to the security devices you want the vSMS to manage, and then click **OK**.
- 

## Start the vSMS server

---

### Procedure

1. Expand the datacenter and datastore folders until you see the virtual machine where you installed vSMS.
  2. Right-click the vSMS and select **Power > Power On**.
  3. When the virtual machine is powered on, you can open a console to monitor the booting of the guest operating system. To do this, right-click the virtual machine and select **Open Console**.
- 

## Deploy the vSMS software on KVM

The vSMS contains a ready-to-configure virtual instance of SMS. When the vSMS is deployed, the SMS software running in the virtual appliance operates in the same manner as if it were running on a physical SMS appliance.

A supported KVM environment must already be set up before you can deploy the vSMS software. For more information, see [System requirements on page 1-2](#).

**Note**

If you are deploying the vSMS on OpenStack, go to [Deploy the vSMS software on OpenStack on page 2-11](#)

Follow these steps to deploy the vSMS software on a kernel-based virtual machine (KVM).

**Procedure**

1. Set up two bridge networks on KVM (for example, br215 and br216). Alternatively, you can set up a single bridge network and specify it twice when you deploy the vSMS package.
2. Copy the vSMS tar package to your system.
3. Extract the package with the `#tar -zxvf <tar filename>` command.
4. Deploy the vSMS package with the following command:

```
#virt-install
--name=<vsms_name>
--ram=32768
--vcpus sockets=2,cores=4
--boot hd
--disk path=<full_path_to_current_dir>/system_disk.raw
--network bridge=br215,model=e1000
--network bridge=br216,model=e1000
--virt-type=kvm
--cpu host
--graphics vnc
```

**Note**

You cannot reuse the system disk file (`system_disk.raw`) to create another VM. To create another VM, copy the vSMS package to a different directory and then extract the system disk file from the vSMS package.

---

5. Use the `#virsh console <vsms_name>` to connect to the console.
- 

## Deploy the vSMS software on Microsoft Hyper-V

The vSMS is a virtual appliance compressed and packaged according to the requirements for Microsoft Hyper-V.

A supported Hyper-V server environment must already be set up before you can install and use the vSMS solution. For more information, see [System requirements on page 1-2](#).

---

### Procedure

1. Download and unzip the vSMS compressed package.
2. Use the Windows Hyper-V manager client software to connect to the Hyper-V server where you want to deploy the vSMS.
3. Select the Hyper-V server where you want to deploy the vSMS.
4. Under the Actions panel, click **Import Virtual Machine**:
  - a. For **Locate Folder**, select the unzipped, vSMS package directory containing the three subdirectories (Snapshots, Virtual Hard Disks and Virtual Machines).
  - b. For **Select Virtual Machine**, select the virtual machine name.
  - c. For **Choose Import Type**, select one of the following options:
    - Register the virtual machine in-place (use the existing unique ID): Uses the directory that you already created.
    - Restore the virtual machine (use the existing ID): Moves the files to a new location.

- (Recommended) Copy the virtual machine (create a new unique ID): Copies the files to a new location.

See [Microsoft Hyper-V documentation](#) for more information on import types.

- d. For **Choose Destination**, change the Hyper-V locations as needed.
  - e. For **Choose Storage Folders**, change the virtual hard disk location as needed.
5. Review the summary and select **Finish** to start the import.

It should take a few minutes to import the vSMS in the Windows Hyper-V manager client.

6. We recommend reviewing the following settings after the vSMS is deployed and before you start the vSMS:
- **Hard Drive settings:** The vSMS hard drive file size is delivered with a 300 GB disk size and a dynamically expanding virtual hard disk. These settings can be modified, depending on the needs of your environment.

**Note**

We recommend increasing the disk size to 600 GB for more storage and changing the disk type to **Fixed** to improve performance.

---

To modify the hard drive:

- a. Select the vSMS.
- b. Click **Settings** in the Actions panel.
- c. In the Hardware panel, under SCSI Controller, select **Hard Drive**.
- d. Under Virtual hard disk, select **Edit**.

From the Edit Virtual Hard Disk Wizard, you can convert or expand the disk size of the hard drive, depending on the needs of

your environment. See [Microsoft Hyper-V documentation](#) for more information.

- **Processor settings:** The vSMS is delivered with 12 virtual processors. You can modify the number of processors by navigating to **Settings > Processor**.
- **Memory settings:** The vSMS default memory is 32 GB. You can modify the memory by navigating to **Settings > Memory**.

**Note**

We recommend that you do not enable the Dynamic Memory setting.

---

- **Network settings:** Assign the first network interface to the virtual network with access to the security devices you want the vSMS to manage.
    - a. Select **Virtual Switch Manager** under the Actions panel to configure the virtual switch.
    - b. Specify the switch configuration for the first network interface for the vSMS.
      1. Select the vSMS.
      2. Click **Settings** in the Actions panel.
      3. In the Hardware panel, select **NIC1**.
      4. Specify the switch configuration.
  - 7. After the vSMS is deployed and all settings have been modified for your environment, click **Start** from the Actions panel. When the virtual machine is powered on, you can open a console to monitor the booting of the guest operating system. To do this, right-click the vSMS and select **Connect**.
-

## Adding a device

Add one or more devices on the SMS to begin managing your TippingPoint system.

For information on adding devices to the SMS, see "Devices" in the *Security Management System User Guide*.

## Deploy the vSMS software on OpenStack

A HEAT template can be used to describe the vSMS infrastructure.

### Note

The TippingPoint vSMS has been tested specifically in the DevStack environment. Similar deployments using Kilo and Liberty are also supported.

---

### Note

You must disable security groups and enable the NoopFirewallDriver for Nova and Neutron.

---

## vSMS emulation requirements

The OpenStack HEAT template requires the following emulation configuration:

- Disk driver – ide

## vSMS functional requirements

The OpenStack HEAT template requires the following functional configuration:

1. Hypervisor – kvm
2. Virtual processors – 8
3. RAM – 32 GB

4. Disk images – 1 system disk
5. Network ports – 2

## Configuring the OpenStack HEAT template

**Note**

The following commands show values for a sample template. You must provide values appropriate for your environment.

---

---

### Procedure

1. Create the networks using neutron command lines:

```
neutron net-create netMgmt --provider:network-type local
```

2. Create the subnets using neutron command lines:

```
neutron subnet-create netMgmt 192.168.2.0/24 --name subnetMgmt
```

3. Create the vSMS flavor:

```
nova flavor-create --is-public true vSMS.flavor auto 12288 300 2
```

4. Import the kvm image.

- a. Untar the files.

```
tar -xvf <vSMS KVM>.tar.gz
```

- b. Create the system disk image.

```
glance image-create  
--name vsms  
--visibility public  
--file system_disk.raw  
--disk-format raw  
--container-format bare  
--property hw_disk_bus=ide
```

```
--property hypervisor_type=qemu
--progress
```

## Template sample

The following template shows values for a sample environment. You must modify the sample template and provide values appropriate for your environment before using the template.

To access a sample HEAT template file, untar the vSMS KVM deployment Tar package and open the vsms\_template.yaml template file.

```
heat_template_version: 2015-04-30

description: Simple vSMS instance with 2 ports. The template
will require the user to use a fixed IP address for the ports.
The flavor should be based on the compute host capability.
parameters:
  vsms_image_id:
    type: string
    label: vSMS System Image
    description: The name of the vSMS system disk image
    default: vsms
  vsms_instance_type:
    type: string
    label: vSMS Instance Type
    description: Type of instance (flavor) to be used for vSMS
    default: vSMS.flavor
  private_net:
    type: string
    label: Network
    description: ID of the network into which vSMS is deployed
    default: netMgmt
  private_net_subnetid:
    type: string
```

```
label: Subnet
description: ID of the subnet into which vSMS is deployed
default: subnetMgmt

resources:
  vsms_port1:
    type: OS::Neutron::Port
    properties:
      network_id: { get_param: private_net }
      fixed_ips:
        - subnet_id: { get_param: private_net_subnetid }

  vsms_port2:
    type: OS::Neutron::Port
    properties:
      network_id: { get_param: private_net }
      fixed_ips:
        - subnet_id: { get_param: private_net_subnetid }

  vtps_simple_instance:
    type: OS::Nova::Server
    properties:
      image: { get_param: vsms_image_id }
      flavor: { get_param: vsms_instance_type }
      networks:
        - port: { get_resource: vsms_port1 }
        - port: { get_resource: vsms_port2 }
```

## Launch the template

You can launch the OpenStack HEAT template you created using the Horizon web-based user interface or the command line interface.

## Launch the OpenStack HEAT template using the Horizon web-based user interface

### Procedure

1. (Optional) Use the following command to validate the template:

```
heat template-validate --template-file <template>.yaml
```

2. Select the template.
3. Enter the template parameters, and then click **Launch**.

Launch Stack

Stack Name 

Creation Timeout (minutes) 

☐ Rollback On Failure 

Password for user "admin" 

Network 

Subnet 

vSMS System Image 

vSMS Instance Type 

Description:

Create a new stack with the provided values.

Cancel

Launch

4. After you launch the vSMS template, review the IP address assigned to the vSMS on OpenStack. You must enter the same IP address and subnet during vSMS OBE.
- 

## Launch the OpenStack HEAT template using the command line interface

---

### Procedure

1. (Optional) Use the following command to validate the template:

```
heat template-validate --template-file <template>.yaml
```

2. Use the following command to launch the template:

```
heat -d stack-create vsms --template-file <template>.yaml
```

---

## Quick troubleshooting tips

Before contacting support, check to see if any issues you have are addressed in the following troubleshooting tips.

### Verifying OpenStack HEAT template properties

**Resolution:** Use the `virsh` utility to dump the template xml file and examine your property settings, including the CPU count, the disk adapter type, and the network adapters:

```
localuser@vTPS-Helion1:~/heat_templates$ virsh

Welcome to virsh, the virtualization interactive terminal.

Type: 'help' for help with commands
      'quit' to quit

virsh #
```

```
virsh # list --all
```

Id	Name	State
3	instance-00000002	running

```
virsh # dumpxml instance-00000002
```

```
<cpu mode='custom' match='exact'>
  <topology sockets='2' cores='1' threads='1' />
</cpu>
<emulator>/usr/bin/kvm-spice</emulator>
<disk type='file' device='disk'>
  <driver name='qemu' type='qcow2' cache='none' />
  <source file='/opt/stack/data/nova/instances/
    56a5d809-5df5-435d-a665-24885891fff6/disk' />
  <target dev='hda' bus='ide' />
  <alias name='ide0-0-0' />
  <address type='drive' controller='0' bus='0' target='0'
    unit='0' />
</disk>
<interface type='bridge'>
  <mac address='fa:16:3e:d8:1e:be' />
  <source bridge='qbr37a85eb2-d0' />
  <target dev='tap37a85eb2-d0' />
  <model type='virtio' />
  <alias name='net1' />
  <address type='pci' domain='0x0000' bus='0x00' slot='0x03'
    function='0x0' />
</interface>
<interface type='bridge'>
  <mac address='fa:16:3e:d8:1e:be' />
  <source bridge='qbr37a85eb2-d0' />
  <target dev='tap37a85eb2-d0' />
```

```
<model type='virtio' />
<alias name='net1' />
<address type='pci' domain='0x0000' bus='0x00' slot='0x04'
      function='0x0' />
</interface>
```

### Examining OpenStack HEAT template events

**Resolution:** Use the `heat event-list <name of stack>` command to see a list of events.

## Chapter 3

### Configuration

This section provides instructions for configuring the SMS server, installing an SMS client, connecting to the server, and performing basic tasks to configure your TippingPoint system.

## Connecting to the server

After you have configured the server and installed the Software License Key, you can install the SMS client and log in to the SMS or connect to the SMS by command line interface (CLI).

**Note**

Do not change the vSMS vNIC settings. The virtual network interface controller (vNIC) settings configured during the deployment of vSMS are required for the application to operate successfully.

---

## Configure the vSMS server

After powering on the server, the SMS Out-of-Box (OBE) Setup Wizard prompts you to perform basic tasks to configure the system. Perform the following steps:

---

**Procedure**

1. Log on to the SMS server as **SuperUser** (no password).
2. Read and accept the end-user license agreement to continue.
3. If needed, select a language for a different keyboard layout.
4. Specify a security level (0 – 3) and create a new SuperUser administrator account and password.
5. Specify the network type, SMS management IP address, network mask, and optional default gateway.
6. Specify a host name to describe the SMS. If desired, enter the optional host location and system contact information.
7. Modify the timekeeping option by enabling NTP Client for your time zone.
8. Modify server options for SSH, HTTPS, and SNMP.
9. As an optional step, you can configure a Network Management System to monitor and receive SNMP traps.

---

## 10. Configure email contact information.

---

### Install the vSMS certificate package

Install the vSMS license certificate package after you download the package from the license manager. See [Download the vSMS certificate package on page 2-3](#) for more information.

---

#### Procedure

1. Open a Web browser and enter the IP address or host name of your vSMS (for example, `https://123.45.67.89`).
2. Click **Select files** and then select the vSMS certificate license package that you downloaded.

The vSMS displays the license activation code.

3. Click **Install Certificate**, and then click **OK** to restart the vSMS.

After the vSMS restarts, you can install the SMS client. See [Install the SMS client on page 3-3](#) for more information.

---

#### Note

If you attempt to refresh the Web browser while the SMS reboots, the page may appear blank. If this happens, use the IP address to reconnect to the SMS after the SMS finishes rebooting.

---

### Install the SMS client

The SMS client can be installed on a physical machine or on a virtual machine.

The client software runs on the following operating systems:

- Windows
- Linux

- Mac OS X

**Note**

Before you can install the SMS client on an OS X computer, you must follow the instructions outlined in the [OS X prerequisites on page 3-4](#).

---

---

**Procedure**

1. On your computer, start your web browser.
2. In your browser address bar, enter the IP address or host name of your SMS appliance. For example: `https://123.45.67.89`.
3. Log in with the **SuperUser** account created during the vSMS Server setup.
4. Click **Client Installation** in the navigation pane.
5. Select the appropriate SMS client installer for your platform and download it.

**Note**

Before you can install the SMS client on an OS X computer, you must follow the instructions outlined in OS X prerequisites.

---

6. Run the installation wizard.

The installation wizard checks for previous installations and guides you through the options for installing or updating the client software. When installation is complete, the installer prompts you to end or open the client upon completion.

---

## OS X prerequisites

### Important information when using Mac OS X to host an SMS client

When you upgrade the SMS client on OS X with Oracle Java Runtime version 1.8u71 or later, the SMS client will not be able to connect to an SMS that is

still running with a 1k certificate key. To avoid this issue, upgrade the SMS from a 1k certificate key to a 2k key.

**Note**

If you have already completed this step in a previous SMS release, you do not need to do this again.

---

If you cannot connect to the SMS using Mac OS X, you have two options:

- Temporarily make the following changes to the JRE on your local Mac OS X.
- Use a Windows SMS client to update the SMS to a 2K certificate key. After you do this, you will no longer need to temporarily change to the JRE on your local Mac OS X (see above).

**How to change the JRE on your local Mac OS X**

1. Edit the `java.security` file located in the `/Library/Internet Plug-Ins/JavaAppletPlugin/Contents/Home/lib/security` directory.
2. Locate `jdk.certpath.disabledAlgorithms=MD2, MD5, RSA keySize < 1024`, and then delete MD5 from the line.

The line should now be `jdk.certpath.disabledAlgorithms=MD2, RSA keySize < 1024`.

3. Locate `jdk.tls.disabledAlgorithms=SSLv3, RC4, MD5withRSA, DH keySize < 768`, and then delete MD5withRSA from the line.

The line should now be `jdk.tls.disabledAlgorithms=SSLv3, RC4, DH keySize < 768`.

4. Open the dmg (disk image) and run the installer application.

**Note**

If you receive the error message "TippingPoint SMS client Installer is damaged and can't be opened", go to Mac System Preferences > security & privacy settings and change "Allow applications downloaded from" to "Anywhere."

---

**Note**

If you receive additional error messages, contact support.

---

## Log in to the SMS

---

### Procedure

1. Launch the TippingPoint SMS client.
2. Specify the IP address or fully qualified host name of the vSMS server.
3. Provide the user name and password for the SuperUser account created when you configured the vSMS server.
4. Click **Login**.

For additional information, see "SMS Client" in the *Security Management System User Guide*.

---

## Distributing a Digital Vaccine

Digital Vaccines (DVs) contain newly developed filters as well as improvements to existing filters and new filter options investigated and distributed by the TMC. These packages are continually updated to fortify your system against new malicious attacks threatening hosts and network services.

You can download, distribute, activate, and manage Digital Vaccines (DVs), Auxiliary DVs, and DV Toolkit packages from the Profiles workspace in the SMS client.

For information on downloading, activating, and distributing Digital Vaccines, see "Download, Activate, and Distribute Digital Vaccines" in the *Security Management System User Guide*.

## Backing up and restoring the SMS database

The SMS database contains data from current and historical events and operations as well as devices the SMS manages.

We strongly recommend that you back up the SMS database periodically to facilitate recovery from an unexpected behavior. You can use the SMS to back up and restore features when migrating from one version of SMS to another. For more information, see "Backup and Restore" in the *Security Management System User Guide*.

**Note**

Before you initiate the restore process, ensure there are no active client connections to the SMS server through the SMS client, command line interface, or Web management console.

---

## Resetting the SMS to factory default

The SMS command line interface accepts the `factoryreset` command to reset the system to factory defaults. For the vSMS platform, this command resets the system to factory default settings for the current version of vSMS, unless you choose to reset the device license key. If you reset the device license key during the factory reset, the system will revert to the factory settings for the original configuration.

For additional information about the SMS command line interface, see the *Security Management System CLI Reference*.

**Note**

Another CLI command, `set license.reset`, removes any new device license keys that have been set.

---

## Where to go next

The SMS is a central console where you can manage multiple TippingPoint devices, products, and services. After the initial setup, you can begin monitoring and managing your TippingPoint systems.

Make sure all TippingPoint devices that you add to the SMS are configured or enabled to accept SMS management. Refer to device product documentation for information about preparing a device for SMS management.

When a TPS or IPS device is enabled for SMS control, the device is exclusively controlled by the SMS. You can unmanage devices in the SMS.

For complete information about managing TippingPoint systems, see the *Security Management System User Guide*, or the SMS online help.

**Note**

To access the SMS command line interface (CLI) you must log in with a SuperUser account. The SuperUser account used to access the CLI must have the following authorization: `SMS_ACCESS_CLI`. For more information about using the CLI, see the *Security Management System Command Line Interface Reference*.
