

## Security Management System (SMS) Release Notes

Version 6.3.0.1

This release includes all issues fixed in the *Security Management System Release Notes Version 6.3.0*. For details about those changes, refer to the respective Release Notes on the [Online Help Center](#).

### Important notes for SMS

- All v6.3.0 customers can optionally apply this patch so that the issues it addresses are corrected. However, upgrades to a later TOS do not require an installation of this patch first.
- Patch installation should take approximately 15 minutes.
- To prevent your account from being disabled while you wait for authentication resources to become available after the reboot, navigate to **Edit > Preferences** and make sure that you deselect **Lock user after failed login attempts** and **Auto reconnect client to server after a disconnect occurs**. The SMS automatically reboots after you install this release.
- This patch can be uninstalled or rolled back to the previous version.

### Release contents

The following enhancements or repairs are included in this release.

Description	Reference
A Linux-based regreSSHion vulnerability ( <a href="#">CVE-2024-6387</a> ) relating to a race condition that unauthenticated attackers could trigger through an OpenSSH server (sshd) has been addressed in this release.	VRTS-12508
An issue that prevented the Vertica log rotations from working has been fixed.	TIP-119177
